SUMMARY

Software engineer building production-style backends, ML pipelines and LLM-powered apps in Python, TypeScript and Java, with performance claims backed by measurement.

SKILLS

Languages: Python, TypeScript, JavaScript, Java, SQL, C++
AI/ML: PyTorch, Transformers, scikit-learn, pandas, LLM APIs (Claude, Gemini, OpenAI, Meta)
Backend & Data: FastAPI, Flask, Node.js, Spring Boot, PostgreSQL, Supabase, Firebase
Frontend & Tools: React, React Native, Docker, AWS, Google Cloud Run, GitHub Actions, pytest

EXPERIENCE

Software Engineer - Develop for Good: Cambio Labs (Nov 2026 – Present)

- Part of an engineering team auditing and integrating Sparky, an AI learning coach for Journey, an edtech platform serving about 1,000 low-income learners ages 13–35.
- Evaluating LLM coaching behavior using an LLM-as-judge testing harness across multiple hosted models.

Software Engineer - Utilyze, Inc. (Sep 2026 – Nov 2026)

- Built a PyTorch training and evaluation pipeline for a transformer on single-cell data, with checksummed checkpoints and run records.
- Set up data QC that splits data by animal to avoid leakage, and wrote a frozen transfer evaluation with shuffled-label controls.
- Diagnosed a negative transfer result to the probe rather than the pipeline, using a bug check that verified data alignment and checkpoint integrity.

Software Engineer (Volunteer) - AuntMary's Storybook (Feb 2026 – Jul 2026)

- Rebuilt 10+ legacy PHP pages from Figma designs for a nonprofit connecting incarcerated parents with their kids.
- Owned the recording-session and caregiver features, shipped through PRs and code reviews in Docker.

Software Engineer Intern - Devin (Nov 2025 – Feb 2026)

- Built an LLM-powered companion chatbot in Python and Flask that stayed reliable when upstream API calls failed.
- Ran trials across AI personas and tuned prompts until responses were faster and adapted to each user.

PROJECTS

MOAT – Guard Against AI Agent Data Leaks
Python, FastAPI, React, TypeScript, Server-Sent Events, pytest, Meta Model API

- Built a FastAPI and React app that streams an AI agent's web searches live over Server-Sent Events, turning 16 event types into a side-by-side view of each query passed, rewritten or blocked, with and without the guard.
- Replayed recorded model calls through the same stream, so judges at Meta's hackathon could run the full demo with one command and no API key.
- Built the results dashboard for 60 scored agent runs and a 150-attack suite (145 caught); merged 16 PRs and wrote 14 API tests that isolate test data from the repo.

VoltStream – Real-Time Battery Telemetry Platform
Python, FastAPI, PostgreSQL, React, scikit-learn, Docker

- Streamed telemetry from 100 batteries through FastAPI and PostgreSQL to a live React dashboard.
- Fixed a race condition found in load testing, raising throughput 2–2.5× and cutting median latency up to 69%.
- Benchmarked 3 ML models against a physics baseline on 1.1M rows; shipped the baseline after it won.
- Wrote 355 tests against a real PostgreSQL database; deliberate failure testing exposed and fixed two deadlocks.

LLM Prompt Injection Tester – AI Security Evaluation Tool (team of 5)
TypeScript, React, OpenAI, Gemini and xAI APIs

- Ran three published prompt-injection attacks against GPT, Gemini and Grok, auto-scoring whether each was fooled.
- Built a shared adapter interface so every attack runs identically across providers, with charts and CSV export.

EDUCATION

Texas State University-San Marcos, TX — Graduation: May 2026
Bachelor of Science in Computer Science with Honors — Cumulative GPA: 3.74

LEADERSHIP & INVOLVEMENTS

Adobe Student Ambassador | SWE Member | IEEE Member | Rewriting the Code Member | Dean's List (8 semesters)
